Negative influence of paternal age on clinical intracytoplasmic sperm injection cycle outcomes in oligozoospermic patients

Renata Cristina Ferreira, M.S.,[a,b] *Daniela Paes de Almeida Ferreira Braga, D.V.M., M.S.,*[a,b] *Tatiana Carvalho de Souza Bonetti, M.S.,*[a,b] *Fabio Firmbach Pasqualotto, M.D., Ph.D.,*[c] *Assumpto Iaconelli, Jr., M.D.,*[a,b] *and Edson Borges, Jr., M.D., Ph.D.*[a,b]

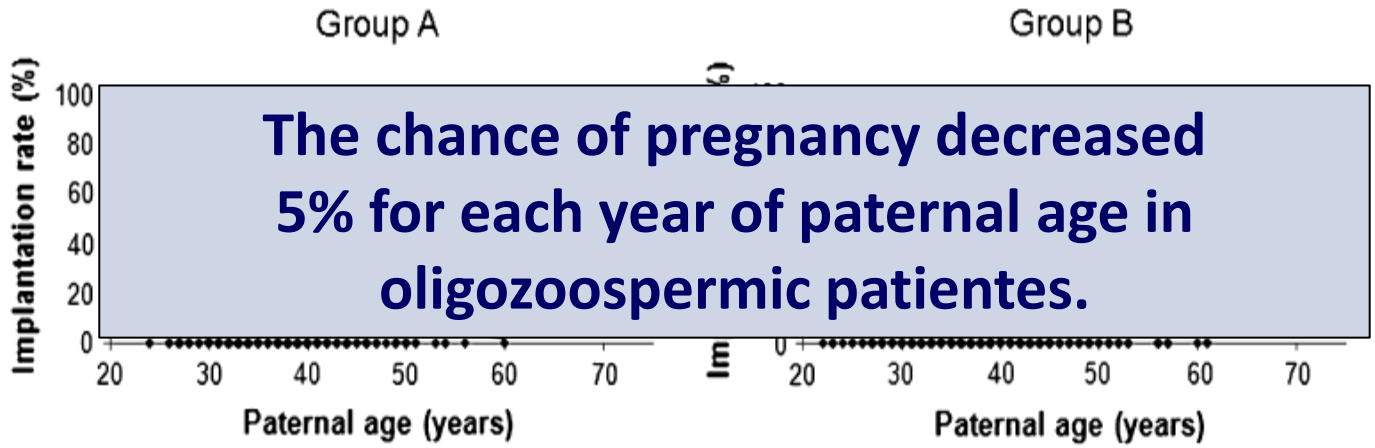
Patient(s): The study included 1,024 couples undergoing ICSI cycles with fresh spermatozoa.

Intervention(s): The influence of paternal age on ICSI outcomes of oligozoospermic and normozoospermic patients was evaluated.

Main Outcome Measure(s): Rates of high-quality embryos, pregnancy, implantation, and miscarriage were evaluated through linear logistic regression analyses.

FIGURE 2

Influence of paternal age on implantation rate. Multiple linear regression was performed and was adjusted for maternal age, numbers of oocytes retrieved, sperm concentration, and fertilization rate. Group A (oligozoospermic patients): $P=.008$, RC = −0.7009 (implantation rate regression equation: in implantation rate = 48.2 − 0.701 paternal age − 0.177 maternal age − 0.220 number of oocyte retrieved − 0.092 sperm concentration + 0.082 fertilization rate); group B (normozoospermic patients): $P=.752$, RC = 0.0566 (implantation rate regression equation: in implantation rate = 32.1 + 0.057 paternal age − 0.758 maternal age + 0.426 number of oocyte retrieved − 0.024 sperm concentration + 0.0542 fertilization rate).



The chance of pregnancy decreased 5% for each year of paternal age in oligozoospermic patientes.

FERTILITY

Is advanced paternal age a health risk for the offspring?

Anne-Marie Nybo Andersen, M.D., Ph.D. and Stine Kjaer Urhoj, M.Sc.
Department of Public Health, University of Copenhagen, Copenhagen, Denmark

Adverse health outcomes in offspring probably affected by advanced paternal age, their occurrence, and assessed evidence for the paternal age effect (strong/medium/weak).

Adverse health condition	Population-based prevalence/lifetime risk	Evidence for a paternal age effect
Fetal death[a]		
Miscarriage (early fetal death)	1,500/10,000 clinically recognized pregnancies	Weak
Stillbirth (late fetal death)	0.4/10,000 births	Medium
Congenital syndromes and anomalies[b]		
Achondroplasia	<1/10,000 births	Strong
Thanatophoric dysplasia	<1/10,000 births	Strong
Osteogenesis imperfecta	<1/10,000 births	Strong
Apert syndrome	<1/10,000 births	Strong
Pfeiffer's syndrome	<1/10,000 births	Strong
Crouzon's syndrome	<1/10,000 births	Strong
Marfan syndrome	2/10,000 births	Strong
Neurofibromatosis (NF-1)	3/10,000 births	Strong
Syndactyly	5/10.000 births	Medium
Cleft palate	15/10,000 births	Strong
Patent ductus arteriosus	5/10,000 births (term babies)	Medium-weak
Down syndrome	5/10.000 births[c]	Weak
Club foot	15/10.000 births	Weak
Other perinatal conditions[a]		
Preterm birth	700/10,000 births	Medium
Preeclampsia	300/10,000 births	Weak
Childhood cancers[a]		
Retinoblastoma	0.6/10,000 individuals	Medium
Acute lymphatic leukemia	12/10.000 individuals	Strong
Neurodevelopmental outcomes[d]		
Autism spectrum disorders	93/10,000 individuals	Strong
Schizophrenia/psychosis	367/10.000 individuals	Strong
Attention deficit-hyperactivity disorder	192/10,000 individuals	Weak
Bipolar disorder	184/10,000 individuals	Weak

[a] If the occurrences vary substantially between countries, we have given population-based occurrence measures from Denmark, 2000–2010.
[b] Prevalence according to www.orpha.net.
[c] Prevalence among births in a population with prenatal screening and termination of pregnancy on demand. The prevalence is approximately 130/10,000 in an unscreened population, depending on parental age distribution.
[d] Lifetime prevalence according to Pedersen et al. (68).

Age-related alterations in the genetics and genomics of the male germ line

Amin S. Herati, M.D.,[a,b] Boryana H. Zhelyazkova, B.A.,[c] Peter R. Butler, B.A.,[a,b] and Dolores J. Lamb, Ph.D.[a,b,c]

Fertility and Sterility® Vol. 107, No. 2, February 2017

Offspring genetic conditions associated with advanced paternal age.

Condition	Paternal age (y)	Relative risk	Population risk	Adjusted risk
Achondroplasia	>50	7.8	1/15,000	1/1,923
Apert syndrome	>50	9.5	1/50,000	1/5,263
Pfeiffer syndrome	>50	6	1/100,000	1/16,666
Crouzon syndrome	>50	8	1/50,000	1/6,250
Neurofibromatosis I	>50	3.7	1/3,000–1/4,000	[illegible]
Retinoblastoma	>45	3	1/15,000–1/20,000	[illegible]
Down syndrome	40–44	1.37	1/1,200[a]	1/876[a]
Epilepsy	40–45	1.3	1/100	1/77.0
Breast cancer	>40	1.6	1/8.5	1/5.3
Childhood leukemia	>40	1.14	1/25,000	1/21,930
Childhood central nervous system tumor	>40	1.69	1/36,000	1/21,302

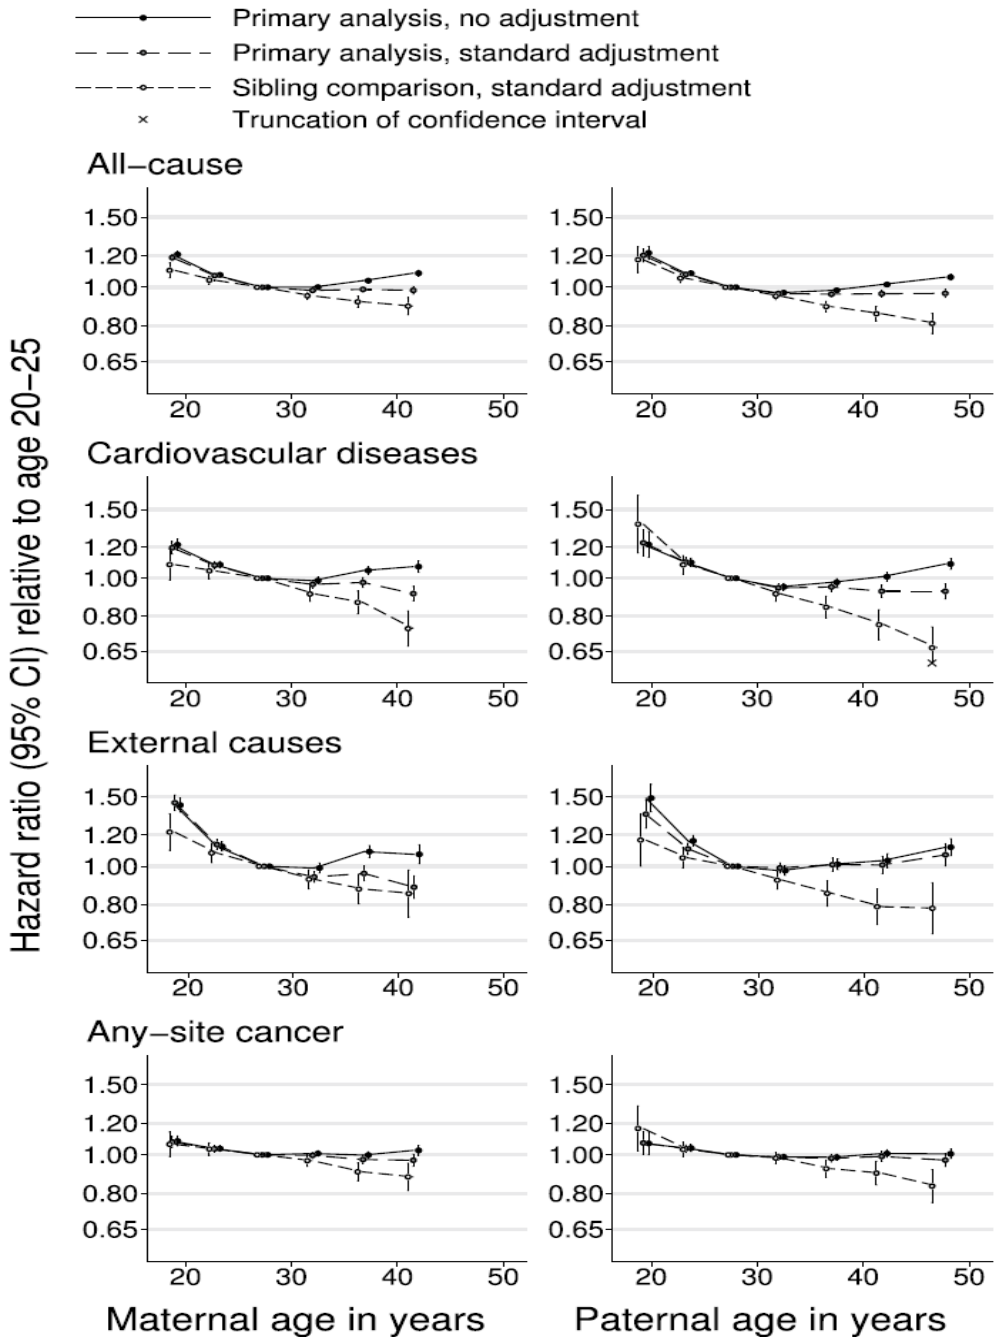
Associations of parental age with offspring all-cause and cause-specific adult mortality

David Carslake[1,2*], Per Tynelius[3], Gerard J. van den Berg[4] & George Davey Smith[1,2]

Swedish registry data to examine all-cause and cause specific adult mortality (293,470 deaths among 5,204,433 people, followed up to a maximum of 80 years old) in relation to parental age.

FERTILITY



Para as causas mais comuns de morte, a sobrevivência adulta foi melhorada na prole de pais mais velhos!!

Idade paterna avançada:
Devemos nos preocupar?
