Fragmentação do DNA do espermatozoide

Edson Borges Jr.

Declaração de Conflito de interesse:

Diretor Científico do FERTGROUP

Resolução do Conselho Federal de Medicina
nº 1.595/2.000

FERTGROUP | FERTILITY

Esterilidade

- Prevalência ao redor de 14% da população
- 85% dos casais conseguem engravidar em 1 ano, 92% conseguem em 2 anos e 93% em 3 anos.
- 1 em cada 6 casais em idade reprodutiva terá dificuldade para engravidar.

Esterilidade

- A incapacidade de conseguir uma gravidez bem-sucedida com *base no histórico médico, sexual e reprodutivo da paciente, idade, achados físicos, testes de diagnóstico ou qualquer combinação desses fatores*.

- *A necessidade de intervenção médica*, incluindo, mas não se limitando à *utilização de gametas ou embriões de dadores*, a fim de conseguir uma gravidez bem-sucedida, *quer como indivíduo, quer com um parceiro*.

- Em pacientes que têm relações sexuais regulares e desprotegidas e sem qualquer etiologia conhecida para qualquer um dos parceiros, sugestiva de capacidade reprodutiva prejudicada, *a avaliação deve ser iniciada aos 12 meses, quando a parceira tiver menos de 35 anos de idade, e aos 6 meses, quando a parceira tiver 35 anos de idade ou mais*.

Esterilidade

Um Problema Médico (doença) !!!

Um Problema de Saúde Pública !!!

ETIOLOGIA DA INFERTILIDADE MASCULINA

- ***fator masculino: 30% - 40%***
- Infertilidade idiopática: 25-30% dos homens
- Doença multifatorial com fenótipo heterogêneo

Envolver o marido na investigação e tratamento!!

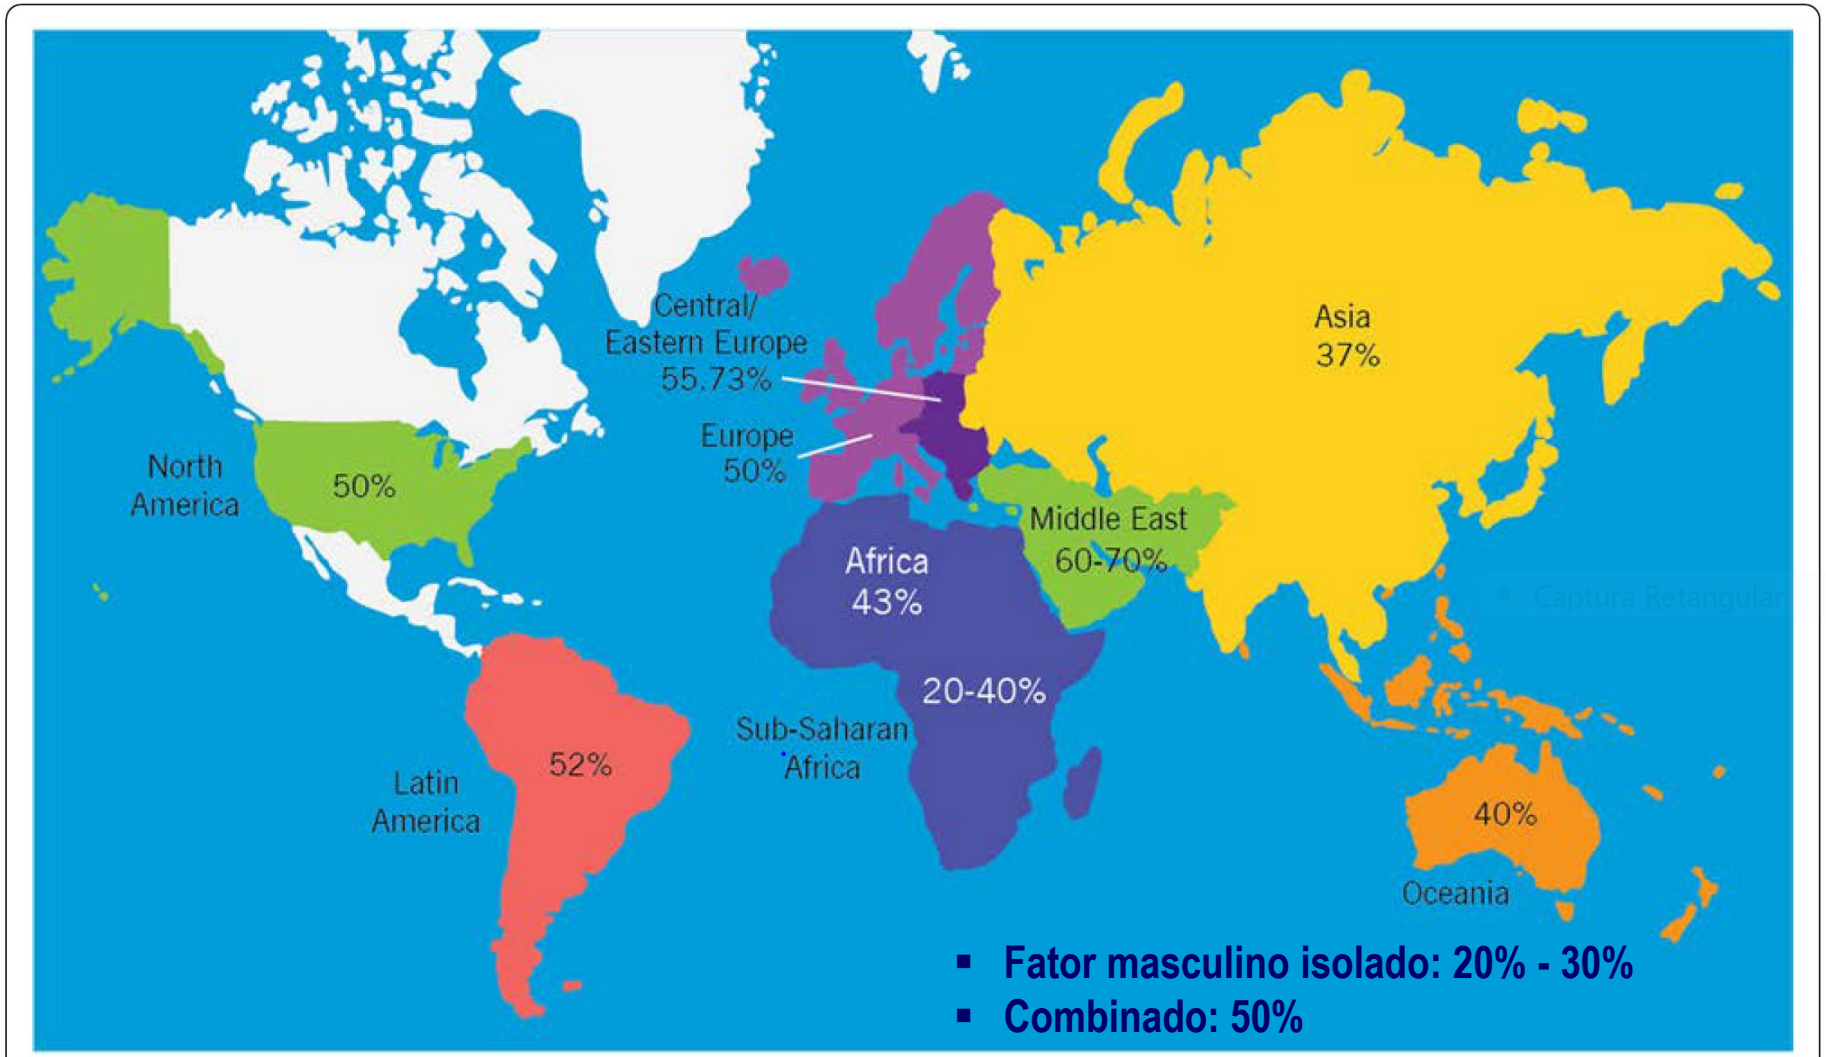

Figure 2 World map containing percentages of infertility cases per region that are due to male factor. This figure demonstrates rates of infertility cases in each region studied (North America, Latin America, Africa, Europe, Central/Eastern Europe, Middle East, Asia, and Oceania) due to male factor involvement.

Agarwal *et al. Reproductive Biology and Endocrinology* (2015) 13:37
DOI 10.1186/s12958-015-0032-1

ANDROLOGIA BASEADA EM EVIDÊNCIAS

- Raros estudos prospectivos, randomizados
  Consequência: resultados inclusivos ou conflitivos

- Etiopatogenia não evidente em 30 - 70% das causas (idiopática)

- Estudos com pouco tempo de acompanhamento, falta de validação por outros grupos, seleção heterogênea de pacientes, grande variação natural da produção espermática

- Nenhum modelo experimental válido para infertilidade masculina

Category	Frequency
Immunological	-
Idiopathic	32.6%
Varicocele	26.6%
Obstruction	15.3%
Normal female factor (unexplained male infertility)	10.7%
Cryptorchidism	
Ejaculatory failure	
Endocrinologic	
Drug/r	
	1.2%
	1.1%
	0.7%
spermia	0.5%
Cancer	0.4%
Systemic disease	0.3%
Infection	0.2%
Torsion	0.1%
Ultrastructural	0.1%
Total	100.0%

Doença multifactorial com fenótipo heterogêneo

Análise Seminal

Investigação:

➢ Análise seminal com morfologia estrita

- 2 amostras (intervalo de 15 dias) ou no intervalo de abstinência ejaculatória
- padronização da coleta
- profissional experiente

✶ ***Fornece dados sobre espermatogênese e permeabilidade do trato reprodutivo***

✶ ***Ondas de espermatogênese ocorrendo simultaneamente, num mesmo túbulo seminífero***

Análise Seminal

Análise Macroscópica

cor, viscosidade, pH, volume, liquefação

Análise Microscópica

concentração, motilidade, morfologia

Pelo menos duas amostras!

Análise Seminal

Não é um teste de fertilidade!

Avaliação do *status* funcional do testículo no momento da coleta

- ***ESTRESSE OXIDATIVO***

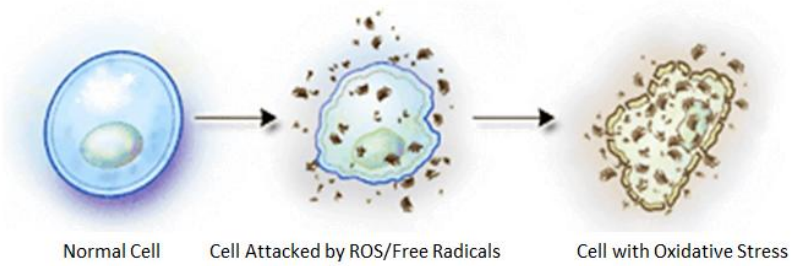

Table 1 Sperm DNA fragmentation (SDF) testing methods

	Test	Principle	Advantage	Disadvantage
 [1]	AO test	Metachromatic shift in fluorescence of AO when bound to single strand (ss)DNA. Uses fluorescent microscopy	Rapid, simple and inexpensive	Inter-laboratory variations and lack of reproducibility
 [2]	AB staining	Increased affinity of AB dye to loose chromatin of sperm nucleus. Uses optical microscopy	Rapid, simple and inexpensive	Inter-laboratory variations and lack of reproducibility
 [3]	CMA3 staining	CMA3 competitively binds to DNA indirectly visualizing protamine deficient DNA. Uses fluorescent microscopy	Yields reliable results as it is strongly correlated with other assays	Inter-observer variability
 [4]	TB staining	Increased affinity of TB to sperm DNA phosphate residues. Uses optical microscopy	Rapid, simple and inexpensive	Inter-observer variability
 [5]	TUNEL	Quantifies the enzymatic incorporation of dUTP into DNA breaks. Can be done using both optical microscopy and fluorescent microscopy. Uses optical microscopy, fluorescent microscopy and flow cytometry	Sensitive, reliable with minimal inter-observer variability. Can be performed on few sperm	Requires standardization between laboratories
 [6]	SCSA	Measures the susceptibility of sperm DNA to denaturation. The cytometric version of AO test. Uses flow cytometry	Reliable estimate of the percentage of DNA-damaged sperm	Requires the presence of expensive instrumentation (flow cytometer) and highly skilled technicians
 [7]	SCD or Halo test	Assess dispersion of DNA fragments after denaturation. Uses optical or fluorescent microscopy	Simple test	Inter-observer variability
 [8]	SCGE or comet assay	Electrophoretic assessment of DNA fragments of lysed DNA. Uses fluorescent microscopy	Can be done in very low sperm count. It is sensitive and reproducible	Requires an experienced observer. Inter-observer variability

[1] Acridine orange (AO) stains normal DNA fluoresces green; whereas denatured DNA fluoresces orange-red. [2] Aniline blue (AB) staining showing sperm with fragmented DNA and normal sperm. [3] Chromomycin A3 (CMA3) staining: protamine deficient spermatozoa appear bright yellow; spermatozoa with normal protamine appear yellowish green. [4] Toulidine blue (TB) staining: normal sperm appear light blue and sperm with DNA fragmentation appear violet. [5] Terminal deoxynucleotidyl transferase dUTP nick end labeling (TUNEL) assay fluorescent activated cell sorting histogram showing percentage of SDF. [6] Sperm chromatin structure assay (SCSA): flow cytometric version of AO staining. [7] Sperm chromatin dispersion (SCD) test: spermatozoa with different patterns of DNA dispersion; large-sized halo; medium-sized halo [2]; very small- sized halo. [8] Comet images showing various levels of DNA damage.

human reproduction OPINION

Use of testicular sperm for ICSI in oligozoospermic couples: how far should we go?

Armand Zini[1,*], Phil V. Bach[2], Ahmad H. Al-Malki[1], and Peter N. Schlegel[2]

- Clinicians should balance these risks prior to the recommendation of TSR-ICSI on the result of a semen analysis or sperm DNA test alone.
- The use of TSR-ICSI in the absence of specific sperm DNA defects is still experimental.

EUROPEAN UROLOGY FOCUS 4 (2018) 299–300

O valor da revisão sistemática é que ela mostra claramente que ***não há base para a aplicação clínica de rotina do TESE em homens sem azoospermia*** e, como tal, esta intervenção, que também aumenta o custo geral do tratamento, ***deve ser confinada a um ambiente de pesquisa***.

FERTGROUP | FERTILITY

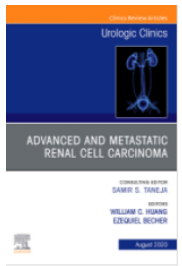
High Sperm DNA Damage
Does Testicular Sperm Make Sense?



Keith Jarvi, MD, FRCSC

Urol Clin N Am 47 (2020) 165–174
https://doi.org/10.1016/j.ucl.2019.12.009

KEYWORDS

• Sperm DNA integrity • In vitro fertilization • Sperm selection • Prospective cohort study
• Live birth rates • Pregnancy rates • Testicular sperm retrieval

KEY POINTS

- High sperm DNA damage increases the risks of pregnancy loss.
- Testicular sperm have less DNA damage than sperm in the ejaculate.
- Using testicular sperm for in vitro fertilization for men with high levels of sperm DNA damage is widely used.
- Presently, there is insufficient evidence to conclude that the use of testicular sperm increases live birth rates compared with ejaculated sperm for men with high levels of sperm DNA damage.
- The use of testicular sperm retrieval for in vitro fertilization to manage men with high sperm DNA damage is not supported by the literature published to date.

DIFFERENCE OF OPINION

Vol. 44 (4): 676-679, July - August, 2018
doi: 10.1590/S1677-5538.IBJU.2018.04.04

Testicular versus ejaculated sperm should be used for intracytoplasmic sperm injection (ICSI) in cases of infertility associated with sperm DNA fragmentation | *Opinion: No*

Mark Sigman [1]

[1] *Department of Urology Brown University and The Miriam Hospitals, RI 02906, EUA*

- A prática testicular recuperação de espermatozoides para casais com SDF elevado e falha FIV/ICSI ***deve ser considerada experimental*** - ensaios controlados randomizados são muito necessários.
- Além disso, ***o potencial risco genético e epigenéticos*** do espermatozoide testicular não deve ser ignorado.

Clinical Consultation Guide – Andrology

European Association of Urology Guidelines Panel on Male Sexual and Reproductive Health: A Clinical Consultation Guide on the Indications for Performing Sperm DNA Fragmentation Testing in Men with Infertility and Testicular Sperm Extraction in Nonazoospermic Men

Tharu Tharakan [a,b], Carlo Bettocchi [c], Joana Carvalho [d], Giovanni Corona [e], Thomas Hugh Jones [f], Ates Kadioglu [g], Juan I. Martínez Salamanca [h], Ege Can Serefoglu [i,j], Paolo Verze [k], Andrea Salonia [l,m,†], Suks Minhas [a,†,],*
on behalf of the EAU Working Panel on Male Sexual Reproductive Health

- O Painel das Diretrizes da EAU sobre Saúde Sexual e Reprodutiva Masculina *não defende o uso clínico de rotina de espermatozoides testiculares em homens não-azoospérmicos com SDF elevado* (TESE-ICSI) fora dos ensaios clínicos.

- Embora os urologistas possam oferecer espermatozoides testiculares em pacientes com alta fragmentação de DNA, *os pacientes devem ser aconselhados quanto aos baixos níveis de evidência para isso* (ou seja, estudos não randomizados).

Fertility and Sterility® Vol. 108, No. 3, September 2017

Potential confounders

- Cinco estudos envolvendo 143 pacientes apresentaram taxas de SDF pareadas para espermatozoides testiculares e ejaculados, revelando SDF mais baixo em espermatozoides testiculares (DM 24,58%).

Os limites do SDF foram 7% (um estudo), 15% (um estudo) e 30% (três estudos).

- Quatro estudos envolvendo 507 ciclos e 3.840 ovócitos relataram resultados clínicos de Testi-ICSI e Ejac-ICSI.

O SDF alto foi definido de acordo com os limiares utilizados em cada estudo: 15% (um estudo), 29% (um estudo) e 30% (dois estudos).

- É importante enfatizar que a maioria dos artigos publicados sobre o uso de espermatozoides testiculares em pacientes com SDF elevada consiste em pequenas coortes ou séries de casos, comparando diferentes populações de pacientes.

- Além disso, vários desses estudos carecem de grupos de controle adequados, uma avaliação adequada de possíveis fatores femininos e, mais importante, alguns não relatam taxas de nascidos vivos.

- Esses estudos também não levam em consideração os custos e riscos mais elevados envolvidos na coleta e no uso de espermatozoides testiculares.

Paternal Contributions to Offspring Health: Role of Sperm Small RNAs in Intergenerational Transmission of Epigenetic Information

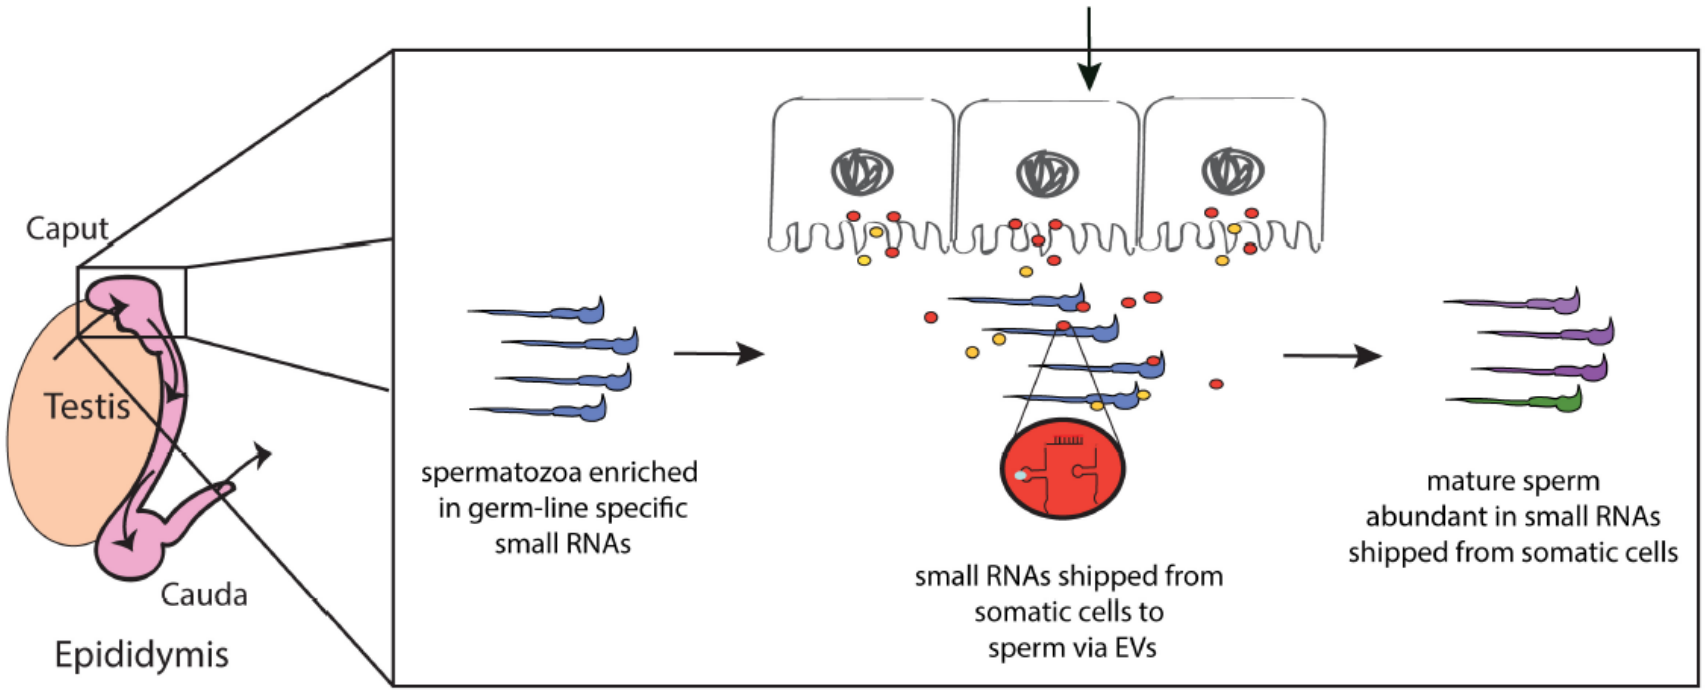
*Upasna Sharma**

Department of Molecular, Cell and Developmental Biology, University of California, Santa Cruz, Santa Cruz, CA, United States

October 2019 | Volume 7 | Article 215

Volume 7, Issue 5
Special thematic issue on the Epididymis
September 2019
Pages 741-747

O epidídimo pode servir como um órgão sensor do ambiente e transmitir essas informações (na forma de pequenos RNAs) para o espermatozóide em maturação e, portanto, para a descendência



FERTGROUP | FERTILITY

Espermatozoide testicular x ejaculado

- Menor eficiência na fertilização, desenvolvimento embrionário, implantação e gestação a termo (Rubio et al., 2001; Chatziparasidou *et al.*, 2015; Ramasamy *et al.,* 2015).
- Maiores taxas de aneuploidia (Bernardini et al., 2000; Rodrigo *et al.*, 2004; Gianaroli et al.,2005; Moskovtsev *et al.,* 2012; Vozdova *et al.*, 2012).
- Perda gestacional ou falha recorrente de sucesso em FIV/ICSI: etiologia bastante controversa, 50% das vezes sem diagnóstico, com possibilidade de sucesso na continuidade do tratamento (N Engl J Med 2012;366:2483–91).

Complicações operatórias

- **Aspiração por agulha fina**: com hemorragia testicular (Friedler et al., 1997), alterações inflamatórias transitórias ou hematomas com duração de até 6 meses de pós-operatório em até 80% pacientes, ou desvascularização do testículo (Schlegel e Su,1997).

- **TESE convencional:** hipogonadismo requerendo TRH em 2,5% dos pacientes, atrofia testicular em 25% dos pacientes e alterações testiculares crônicas em 23% dos pacientes (Okada et al., 2002).

- **microTESE:** alterações inflamatórias e endocrinológicas, com duração de até 12 meses, a fibrose e atrofia testicular (Deruyver et al., 2014).

Considerações

- Metanálises: vários testes de *fragDNA* (funções diferentes), sem grupo controle.
- Outras técnicas para a seleção de espermatozoides sem *fragDNA* no ICSI.
- *fragDNA* espermático: única função espermática a ser considerada?? (função epigenética e hormonal dos epidídimos).

Volume 7, Issue 5

ANDROLOGY WILEY

ORIGINAL ARTICLE

The effect of sperm DNA fragmentation on ICSI outcomes depending on oocyte quality

Daniela Paes Almeida Ferreira Braga[1] | Amanda Setti[1] | Christina Morishima[2] | Rodrigo R. Provenza[1] | Assumpto Iaconelli Jr.[1] | Edson Borges Jr.[1]

- Coorte 2.942 ovócitos fertilizados de 525 ciclos de ICSI.
- Baixa fragmentação <30%de fragmentação do DNA do espermatozoide, n = 1468
- Alta fragmentação ≥30% de fragmentação, n = 486.
- Ovócitos maduros foram examinados para dismorfismos intracitoplasmática e extracitoplasmática

- ***Significant increases in the rates of fertilization, high-quality embryo, implantation, and pregnancy were noted for cycles with <30% sperm DNA fragmentation*** than cycles with ≥30% sperm DNA fragmentation (regardless of the presence of oocyte dimorphisms).

- ***The presence of dimorphisms significantly impacted laboratory and clinical outcomes***.

- ***The lowest fertilization and high-quality embryo rates*** were observed when a high sperm DNA fragmentation index was associated with the presence of dark cytoplasm, vacuoles, resistant membrane, and non-resistant membrane.

- ***The lowest implantation and pregnancy rates*** were observed when a high sperm DNA fragmentation index was associated with the presence of vacuoles, defective perivitelline space, and fragmented polar body.

FERTGROUP | FERTILITY

Andrology. 2023;11:1682–1693

- ***The effect of sperm DNA fragmentation on miscarriage rates*** was significantly influenced by the presence of centrally located cytoplasmic granulation, a defective perivitelline space and non-resistant membrane.

Conclusion: A high sperm DNA fragmentation index increases the likelihood of miscarriage in intracytoplasmic sperm injection cycles, an effect that may potentially be magnified by the presence of oocyte dysmorphisms.

Andrology. 2023;11:1682–1693

Antioxidants for male subfertility

Showell MG, Brown J, Yazdani A, Stankiewicz MT, Hart RJ

Published Online: March 14, 2012

Oxidative stress may cause sperm cell damage. This damage can be reduced by the body's own natural antioxidant defences. Antioxidants can be part of our diet and taken as a supplement. It is believed that in many cases of unexplained subfertility, and also in instances where there may be a sperm-related problem, taking an oral antioxidant supplement may increase a couple's chance of conceiving when undergoing fertility treatment. This review identified 34 randomised controlled trials involving 2876 couples. Pooled findings from three small trials suggest an increase in live birth rates for the partners of subfertile men taking an antioxidant supplement as part of an assisted reproductive program. However, further well-designed large randomised placebo-controlled trials are needed to confirm these findings.

- 34 estudos randomizados – 2.876 casais
- Aumento da taxa gestação (OR=4,18)
- Aumento na taxa de nascidos vivos (OR=4,85)
